0.1 Problem 3

Let's assume that a positive integer n has no divisor d that satisfies $\sqrt{n} \le d \le \sqrt[3]{n^2}$. Prove that n has a prime divisor $p > \sqrt[3]{n^2}$.

```
theorem problem 3:
 fixes n :: nat
 assumes [iff]: n \neq 0
 assumes divrange: \bigwedge d :: nat. sqrt n \leq d \implies d \leq n powr (2/3) \implies \neg d dvd n
 obtains p where prime p and p > n powr (2/3)
 have forbidden-range: \neg d dvd n if n powr (1/3) \le d and d \le n powr (2/3) for d :: nat
 proof
   assume d \ dvd \ n
   from that consider
   (low) \ n \ powr \ (1/3) \le d \ d \le sqrt \ n \ |
   (high) \ sqrt \ n \le d \ d \le n \ powr \ (2/3)
     by fastforce
   then show False
   proof cases
     \mathbf{case}\ low
     from \langle d \ dvd \ n \rangle have mirror-divisor: (n \ div \ d) \ dvd \ n by auto
     have n/d \leq n / n \ powr \ (1/3)
       using low by (simp add: frac-le)
     also have ... = n powr 1 / n powr (1/3) by auto
     also have ... = n powr (2/3) by (simp del: powr-one flip: powr-diff)
     finally have n/d \le n \ powr \ (2/3).
     moreover from \langle d \ dvd \ n \rangle have n/d = n \ div \ d by auto
     ultimately have upper-bound: n \ div \ d \le n \ powr \ (2/3) by auto
     from \langle d \ dvd \ n \rangle have d \neq 0
       by (meson \langle n \neq 0 \rangle dvd-0-left)
     hence n/d \geq n / sqrt n
       using low by (simp add: frac-le)
     also have n / sqrt n = sqrt n
       using real-div-sqrt \langle n \neq \theta \rangle by auto
     finally have n/d \geq sqrt \ n.
     hence lower-bound: n \ div \ d \geq sqrt \ n \ using \langle n/d = n \ div \ d \rangle by auto
     show False using divrange [of n div d] mirror-divisor
       and lower-bound upper-bound by auto
   next
     case high
     then show False using divrange \langle d \ dvd \ n \rangle by auto
   qed
 qed
 have n > 1
 proof -
   {
     assume n = 1
     with divrange [of 1] have \neg 1 \ dvd \ 1 by auto
     moreover have 1 dvd (1::nat) by auto
     ultimately have False by contradiction
   thus n > 1 using \langle n \neq 0 \rangle
     by fastforce
 qed
```

```
let ?smalldivs = \{d. d dvd n \land d < n powr (1/3)\}
 have finite ?smalldivs using finite-divisors-nat by fastforce
 moreover have ?smalldivs \neq \{\} proof –
   have 1 \in ?smalldivs using \langle n > 1 \rangle by auto
   thus ?thesis by auto
 qed
 moreover define a where a = Max ?smalldivs
 ultimately have a \in ?smalldivs using Max-in by auto
 hence a < n \ powr \ (1/3) and a \ dvd \ n by auto
 hence a \neq 0 using \langle n \neq 0 \rangle by algebra
 have \bigwedge d. d dvd n \Longrightarrow d > a \Longrightarrow d \ge n powr (1/3)
   using Max-ge \langle finite ?smalldivs \rangle \langle ?smalldivs \neq \{\} \rangle a-def
   by (metis (no-types, lifting) mem-Collect-eq not-le)
 hence div-above-a: \bigwedge d. d dvd n \Longrightarrow d > a \Longrightarrow d > n powr (2/3)
   using forbidden-range
   by force
 note \langle a < n \ powr \ (1/3) \rangle
 also have n powr (1/3) < n powr 1 using (n > 1) by (intro powr-less-mono) auto
 finally have a < n by auto
 hence n \ div \ a > 1
   using \langle a \ dvd \ n \rangle by fastforce
 then obtain p where prime p and p dvd (n div a)
   by (metis less-irrefl prime-factor-nat)
 hence p*a \ dvd \ n \ using \langle a \ dvd \ n \rangle and \langle n \ div \ a > 1 \rangle
   by (metis div-by-0 dvd-div-iff-mult gr-implies-not-zero)
 with div-above-a [of p*a] have p*a > n powr (2/3)
   using (prime p) and prime-nat-iff by fastforce
 moreover have a * n powr (1/3) < n powr (1/3) * n powr (1/3)
   using \langle a < n \ powr \ (1/3) \rangle by auto
 moreover have ... = n powr (2/3) by (simp flip: powr-add)
 ultimately have p*a > a*n powr (1/3) by simp
 hence p > n \ powr \ (1/3) \ using \langle a \neq 0 \rangle \ by \ simp
 hence p > n powr (2/3) using forbidden-range [of p] and (p * a \ dvd \ n) by force
 moreover note \langle prime p \rangle
 ultimately show ?thesis using that [of p] by auto
qed
end
